

# 1. State Chart 2 Finite State Machine Example

This example Specifies a transformation that converts models belonging to the StateChart (A hierarchical concurrent state machine) paradigm to a semantically equivalent model in the FiniteStateMachine paradigm.

## 1.1. Directory Organization

-  **StateChart**
  - HSM2FSM.mga - SC 2 FSM transformation
  - HSM2FSM.xme - transformation exported
  -  **Meta**
    -  **Icons**
      - Icons for the paradigms
    - FiniteStateMachine.mga - FSM metamodel
    - FiniteStateMachine.xme - FSM metamodel exported to XML
    - FiniteStateMachine.xmp - FSM paradigm file
    - FiniteStateMachine-uml.mga - UML class diagram of FSM
    - FiniteStateMachine-uml.xme - Exported to XML
    - StateChart.mga - SC metamodel
    - StateChart.xme - SC metamodel exported to XML
    - StateChart.xmp - SC paradigm file
    - StateChart-uml.mga - UML class diagram of SC
    - StateChart-uml.xme - Exported to XML
  -  **Models**
    - TwoBitCounter.mga - Example model for SC paradigm
    - TwoBitCounter.xme - Example model exported
    - ThreeBitCounter.mga - Example model for SC paradigm
    - ThreeBitCounter.xme - Example model exported
  -  **Udm** - Will contain the Udm meta files
  -  **Gen**
    - Gen.dsp - project file to compile generated code
    - Gen.dsw - workspace to compile generated code

## 1.2. How to run StateChart 2 Finite State Machine example?

Step 1: Register StateChart and FiniteStateMachine paradigms

- Open GME, choose File/RegisterParadigms, click on “Add From File”, and choose \$/meta/StateChart.xmp;
- Repeat process with \$/meta/FiniteStateMachine.xmp

Step 2: Open HSM 2 FSM transformation model

- Directly open \$/ HSM2FSM.mga, if it fails, open GME, choose File/Import XML, and choose \$/ HSM2FSM.xme

HSM2FSM.mga contains the transformation rules, UDM compatible meta information paradigms and configuration information. Following is the folder structure which is shown in browser:

-  HSM2FSM
  -  StateChart - Input Metamodel in UML class diagram format
  -  FiniteStateMachine - Output Metamodel in UML class diagram format
  -  CrossLinks - UML class diagram for cross reference associations
  -  zt\_HSM2FSM - Folder containing the transformations
  -  zz\_Config - Folder containing configuration information

Step 3: Run the HSM 2 FSM transformation model

- Invoke the GReAT Master Interpreter with icon  (**This is a required step for the first time running**). Use the default file paths provided.
- The transformations can be invoked in various ways
  1. GR Engine – Performs the transformations in an interpretive manner
  2. GR Debugger – Provides a user interface and debugging features such as break points, single step, step into etc.
  3. Code generator – Converts the transformation into code that can be compiled and executed.
- To run GR Engine, it could be done either :
  - In the same dialog of GReAT Master Interpreter, check the box of “Run GR Engine”;
  - Directly invoke the GR Engine interpreter with icon .
  - The default input file is \$/Models/TwoBitCounter.mga
  - The output files will be \$/Models/OutSC.mga and \$/Models/OutFSM.mga
- To run the GR Debugger
  - Open a command prompt and go to the sample directory \$/.
  - Invoke GRD by calling GRD.exe
  - Load the config file \$/config.mga
- To run Code Generator, it could be done either :
  - In the same dialog of GReAT Master Interpreter, check the box of “Run Code Generator”;
  - Directly invoke the Code Generator interpreter with icon .
  - After the files have been generated open \$/gen/gen.dsw and compile the project
  - You can run the generated code with default arguments by setting the working directory to be ..\ and Program argument to be -d
